

About the Authors

Peter Brawley has been designing and developing database software for nearly thirty years—since he found more interest in the software running his neurobiology experiments than in the experiments themselves. Since then he has been building database software for scientific research and enterprise-level database applications for North American manufacturers of autos, home products and other products, for a large movie studio, and for other clients big and small. With Arthur he has published database development tools for database developers. He edited one of Arthur's books, co-authored another, has been a speaker at innumerable software meetings in North America, Europe, the Middle and Far East, and Africa, and writes for database magazines and ezines.

After writing thirty-odd screenplays, *Arthur Fuller* finally sold one, and spent some of the money on his first computer. Within a month he was addicted to programming. For the past thirty years or so he has been developing database applications for worldwide travel agencies, pulp and paper mills, Canadian politicians, and many other clients, large and small, and with Peter has been developing and publishing productivity tools for database software developers. He is the author of a book on database application development, is co-author with Peter of another such book, and has been a speaker at innumerable software development meetings in North America, Europe and Asia. He is Builder.com's SQL Tips columnist and writes frequently for other database magazines and ezines.
